Multiple source tables

- Using more than a single table of a database is usually essential.
- The basic form is just to list all the needed tables in the from line.
- You do have to explain to the DBMS how the tables should be joined together...

JOIN conditions

SELECT * from driver;

NAME	DOB
Jim Smith	11 Jan 1980
Bob Smith	23 Mar 1981
Bob Jones	3 Dec 1986

OUTER JOIN

- Consider the last line of the unconstrained join...

REGNO	MAKE	COLOUR	PRICE	OWNER	NAME	DOB
SC04 BFE	SMART	BLUE	13000		Bob Jones	3 Dec 1986

- This is a car without an owner.
- Sometimes we want to see the rows that fail the join condition due to NULL values.
- To see NULL joins we use OUTER JOIN.
- The JOIN discussed up to this point is known as INNER JOIN.
- We will discuss this more in the relational algebra section.

- Really outer join means we want to force all the rows in one of the tables to appear in the result.
- There are some variants to OUTER JOIN, depending on which rows you want to keep.

INVESTOR IN PEOPLE

NAPIER UNIVERSITY
EDINBURGH

- Consider this:

FROM car JOIN driver on (driver = name)

↖ To the RIGHT of the JOIN

↙ To the LEFT of the JOIN

- If you want all the rows in CAR to always be in the answer, you need a LEFT OUTER JOIN
- If you want all the rows in DRIVER to always be in the answer, you need a RIGHT OUTER JOIN

- In our example the NULL causing the problem is in OWNER, which is in the table CAR.
- CAR is to the left of the word JOIN
- We need a LEFT OUTER JOIN (which is written LEFT JOIN).

```
SELECT *  
FROM car LEFT JOIN driver ON ( owner = name )  
;
```

```
SELECT *  
FROM car LEFT JOIN driver ON ( owner = name )  
;
```

REGNO	MAKE	COLOUR	PRICE	OWNER	NAME	DOB
F611 AAA	FORD	RED	12000	Jim Smith	Jim Smith	11 Jan 1980
J111 BBB	SKODA	BLUE	11000	Jim Smith	Jim Smith	11 Jan 1980
A155 BDE	MERCEDES	BLUE	22000	Bob Smith	Bob Smith	23 Mar 1981
K555 GHT	FIAT	GREEN	6000	Bob Jones	Bob Jones	3 Dec 1986
SC04 BFE	SMART	BLUE	13000			

INVESTOR IN PEOPLE

NAPIER UNIVERSITY
EDINBURGH

FULL OUTER JOIN

- With a LEFT OUTER join, you keep all the rows from the left.
- With a RIGHT OUTER join, you keep all the rows from the right.
- What if you want to keep all the rows from both sides?
 - You need FULL OUTER join, known as FULL JOIN.
- Consider a new row, David Davis, to DRIVER. David owns no cars.

NAME	DOB
Jim Smith	11 Jan 1980
Bob Smith	23 Mar 1981
Bob Jones	3 Dec 1986
David Davis	1 Oct 1975

Example: LEFT

```
SELECT *  
FROM car LEFT JOIN driver ON ( owner = name )  
;
```

REGNO	MAKE	COLOUR	PRICE	OWNER	NAME	DOB
F611 AAA	FORD	RED	12000	Jim Smith	Jim Smith	11 Jan 1980
J111 BBB	SKODA	BLUE	11000	Jim Smith	Jim Smith	11 Jan 1980
A155 BDE	MERCEDES	BLUE	22000	Bob Smith	Bob Smith	23 Mar 1981
K555 GHT	FIAT	GREEN	6000	Bob Jones	Bob Jones	3 Dec 1986
SC04 BFE	SMART	BLUE	13000			

Example: Right

```
SELECT *  
FROM car RIGHT JOIN driver ON ( owner = name )  
;
```

REGNO	MAKE	COLOUR	PRICE	OWNER	NAME	DOB
F611 AAA	FORD	RED	12000	Jim Smith	Jim Smith	11 Jan 1980
J111 BBB	SKODA	BLUE	11000	Jim Smith	Jim Smith	11 Jan 1980
A155 BDE	MERCEDES	BLUE	22000	Bob Smith	Bob Smith	23 Mar 1981
K555 GHT	FIAT	GREEN	6000	Bob Jones	Bob Jones	3 Dec 1986
					David Davis	1 Oct 1975

Naming

- Sometimes column names can be ambiguous.
- Take two tables, called ALPHA and BRAVO. Lets assume each table has a column called NAME.

```
SELECT name from ALPHA,BRAVO;
```

- This query fails, as since NAME is in both tables the DBMS cannot work out which NAME you want.
- You can tell the DBMS, by putting the table name in front of the column name, separated by a dot.

```
SELECT alpha.name from ALPHA,BRAVO;
```

Aliases

- If you are writing a big query, you can find yourself typing the same long table names in again and again.
- This can be quite prone to errors.
- SQL allows us to rename tables for the duration of a query.
- You put the new name immediately after the table name in FROM, separated by a space.

- Rather than:

```
SELECT car.owner FROM car;
```

- You can say

```
SELECT c.owner FROM car c;
```

- This also works for JOIN.

```
SELECT c.regno, c.owner, d.dob  
FROM car c JOIN driver d on (c.owner = d.name)
```

- It makes it much easier for the user to work out what values are coming from which table.

Selfjoin

- A selfjoin, or an equijoin, is where the same table is used twice in a FROM line.
- It indicates a need to use a single table in two different ways simultaneously.
- Consider the question “Who drives a car the same colour as Bob Smith”?

SELECT colour FROM car WHERE owner = 'Bob Smith';

Colour
BLUE

SELECT owner FROM car
WHERE colour = 'BLUE'
AND owner != 'Bob Smith'
AND owner not null;

owner
Jim Smith

INVESTOR IN PEOPLE

NAPIER UNIVERSITY
EDINBURGH

```
SELECT other.owner
FROM car bobsmith, car other
WHERE bobsmith.colour = other.colour -- 1
AND bobsmith.owner = 'Bob Smith' -- 2
AND bobsmith.owner != other.owner -- 3
AND other.owner NOT NULL -- 4
;
```

VIEWS

- VIEWS are to a database what subroutines are to a programming language.
- A view allows us to store a query in the database, so that we can access it later by name.
- We treat views in the same way as a normal table when writing queries.

- Lets write a query to tell us how many drivers and how many cars are in the database.
- We could write them separately...

```
SELECT count(*) from DRIVER;  
SELECT count(*) from CAR;
```

- However this is two queries, and we want to do it in one query...
- Lets store the two queries in two different VIEWS.

```
CREATE VIEW count1 (total) AS select count(*) from driver;  
CREATE VIEW count2 (total) AS select count(*) from car;
```

```
Select * from count1;
```

Total
3

```
Select * from count2;
```

Total
5

```
Select count1.total,count2.total  
from count1,count2;
```

Total	Total
3	5

Deleting a VIEW

- When you are finished with a VIEW you have created you can delete it.
- You do with with the DROP VIEW command.
- For our example...

```
DROP VIEW count1;
```

```
DROP VIEW count2;
```
